

### Exercise 1

Give the asymptotic tight bounds ( $\Theta$ ) on the following functions of  $n$ . Here,  $k \geq 1$  and  $c > 1$  are constants. Hint: you might want to take a look at some of the classic functions and their properties in Section 3.3 CLRS.

1.  $0.001n^2 + 70000n$
2.  $2^n + n^{1000}$
3.  $n^k + c^n$
4.  $20 \log n + n^k$
5.  $2^n + 2^{n/2}$
6.  $n^{\log c} + c^{\log n}$
7.  $13n^4 + 7n^3 - 9n^2 + 127n + \frac{n!}{7}$

### Exercise 2

Consider the following function  $f(n) = 3n \log n + 15n + 1800$  and prove that it is in  $O(n \log n)$  (hint: find constants  $c$  and  $n_0$  such that  $f(n) \leq c(n \log n)$  for all  $n \geq n_0$ ).

### Exercise 3

Consider the pseudo-code for the following mysterious sorting function  $\text{SORT}(A)$ :

$\text{SORT}(A)$

```
1   $n = A.length$ 
2  for  $i = 1$  to  $n$ 
3      for  $j = i + 1$  to  $n$ 
4          if  $A[i] > A[j]$ 
5               $key = A[i]$ 
6               $A[i] = A[j]$ 
7               $A[j] = key$ 
8  return  $A$ 
```

1. Explain informally how the algorithm works.
2. Prove that  $\text{SORT}$  correctly solves the sorting problem (hint: determine suitable invariants for both loops)
3. Determine the asymptotic worst-case running time in terms of upper bound  $O$  and lower bound  $\Omega$ .
